

Salt affects our water

Residential Snow and Ice Care

Did you know...

Since the early 1950s our metro area waters have become increasingly salty. Chloride levels have risen so high that many metro area creeks are now considered unhealthy.

Chlorides harm plants and animals, contaminate our drinking water, damage buildings, and corrode vehicles, roads and bridges. Too much salt results in costly damages and serious environmental consequences.

**Help keep our
water clean!**

This brochure created in collaboration with WMWA and
Nine Mile Creek Watershed District

You Can Prevent Storm Water Pollution

Any salt that enters a storm drain does not go to a waste treatment facility. It goes directly into a local lake or river.

Storm drains carry excess water from streets and homes to nearby lakes and rivers; that makes your property a waterfront property. During the cold winter months, salt that is applied to our streets eventually flows into our lakes and rivers. Help keep our waters clean this winter by following these few simple steps.

1

Before the storm

Apply a liquid de-icer before snow storms to prevent snow and ice from building up. However, this is not a substitute for shoveling; it just makes it more effective.

TIP:

You can make your own liquid de-icer! Mix 2 cups of hot water and one cup of salt.

2

Shovel that snow

Shovel, snow blow, plow and/or sweep. These are all effective measures that will remove snow and minimize ice build-up.

3

Less is better

When applying salt, if there are leftover crystals still visible, the salt has been over applied. The left-over salt can be swept up and reused or disposed of in the trash.

4

Temperature Matters

At low temperatures salt begins to become less effective; check your product for more details. When the temperature falls below 15° F consider using sand as an alternative to salt.
